COMPETITION RULES

SUBMISSION DEADLINE:

Sunday (11/10/2026), 09:30 A.M. SHARP. A strict submission buffer will be enforced **30 minutes** before the deadline to prevent technical issues.

SUBMISSION REQUIREMENTS

Each team must submit:

1. **GitHub Link (Must be set to PUBLIC)**
2. **Deployed application link**
3. **Presentation slide upload (PDF format)**
4. **Group Name & Campus Branch**

PITCHING FORMAT & JUDGING

Stage	Setting
Phase 1 – Local Branch Demos	5 minutes total per team (3 mins live presentation + 2 mins Q&A). Teams pitch locally to their branch judges in person.
Top 18 Shortlisting	Across all chapters
Phase 2 – Global Sync Demos	Top 18 teams from across all campuses pitch in a live sync video call. 7 minutes total per team (4 mins demo + 3 mins Q&A).
Top 3 Delibration & results	Online/ live sync – announced across all branches (Selection is purely on merit across the 3 branches (Top 1: Taylor's, Top 2: UPM, Top 3: Swinburne stream cuts)

PROBLEM STATEMENT

TRACK 1: PREDICTIVE MODEL TRACK — PREDICT EARLY, DECIDE BETTER

How can AI spot problems before they become expensive, and help someone decide what to do about them?

TRACK 2: WORKBUDDY TRACK — AGENTIC SOLUTIONS

How can AI help students and small businesses solve real business problems and operate more effectively?

TRACK 1: PREDICTIVE MODEL TRACK

PROBLEM STATEMENT & EXPECTED OUTCOME

1. How can we leverage AI and predictive analytics to identify emerging risks, forecast future outcomes, and support timely, informed decision-making before costly failures or losses occur?
2. Develop an AI-powered solution that detects, predicts, or forecasts meaningful events from data and converts those insights into actionable decisions.

EVERY SOLUTION SHOULD DEMONSTRATE THE ABILITY TO:

- **Detect:** Predict failures, forecast future values, or identify unusual patterns.
- **Categorize:** Explain what type of issue has been detected, not simply that something is abnormal.
- **Prioritize:** Rank findings based on business impact, financial cost, operational risk, or urgency.
- **Explain:** Provide clear, understandable reasoning that allows non-experts to take action confidently.

TRACK 1: PREDICTIVE MODEL TRACK

WHAT MAKES A STRONG SOLUTION & CORE JUDGING QUESTION

A STRONG SOLUTION SHOULD:

- Solve a specific, real-world problem
- Clearly identify the user who benefits from the solution
- Support decision-making, not just prediction
- Perform robustly on noisy or unfamiliar data
- Minimize false alarms
- Clearly communicate recommendations and reasoning
- Demonstrate measurable impact through realistic assumptions

CORE JUDGING QUESTION

Does your model help someone make a better decision, and can you prove it?

TRACK 1: PREDICTIVE MODEL TRACK

WHAT MAKES A STRONG SOLUTION & CORE JUDGING QUESTION

PARTICIPANTS ARE ENCOURAGED TO EXPLORE REAL-WORLD APPLICATIONS SUCH AS:

- Predictive maintenance and industrial intelligence
- Supply chain anomaly detection
- Quality and defect prediction
- Renewable energy forecasting and optimization
- Battery charging and maintenance planning
- Financial audit and fraud detection

TRACK 2: AGENTIC SOLUTION

PROBLEM STATEMENT & EXPECTED OUTCOME

How can we leverage WorkBuddy and AI Agents to autonomously solve real-world problems by understanding goals, planning workflows, using tools, and delivering complete end-to-end outcomes for users?

THE AGENT SHOULD BE CAPABLE OF:

- Understanding the Goal
- Planning Tasks
- Executing Actions
- Collaborating & Validating
- Integrating Results
- Delivering the Final Outcome

Hackerdorm BUILDERX TAYLOR'S UNIVERSITY Wisdom · Integrity · Excellence UPM UNIVERSITI PUTRA MALAYSIA BERILMU BERBAKTI SWINBURNE UNIVERSITY OF TECHNOLOGY

TRACK 2: AGENTIC SOLUTION

WHAT MAKES A STRONG SOLUTION & CORE JUDGING QUESTION

WHAT MAKES A STRONG SOLUTION?

1. Real Problem and User Value

The solution addresses a clear, meaningful problem with a well-defined user and demonstrates measurable value.

2. Agentic Workflow

The solution showcases intelligent task planning and execution rather than simply generating responses.

Examples include:

- Autonomous task decomposition
- Multi-step execution
- Tool calling
- Agent collaboration
- Parallel workflows
- Validation and quality control
- Dynamic adaptation based on outcomes

3. Meaningful Use of WorkBuddy

WorkBuddy serves as the primary execution platform, enabling agents to perform real work rather than acting as a simple chat interface.

4. End-to-End Execution

A strong solution achieves:

One Prompt → One Goal → End-to-End Execution

Users should not need to manually guide every intermediate step.

5. Usable & Verifiable Results

The final output should be reliable, complete, practical, and demonstrably useful to the target user.

CORE JUDGING QUESTION

Can your AI Agent use WorkBuddy to solve a real problem and actually get things done?
